No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

Polymeriase enhancing tactor proteins, extracts a improve the polymerisation activity of nucleic a use in amplification, sequencing and replication	Polymerase enhancing factor proteins, extracts and complexes - improve the polymerisation activity of nucleic acid polymerases, for use in amplification, sequencing and replication

us-08-957-709-77.rag

```
This sequence represents a secreted human protein encoded by the gene clone detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AAX79002) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 35 novel genes and their fragments (nucleic acid sequences: AAX7901-X79064; amino acid sequences AAX14411-Y14464) which are useful for preventing, treating or ameliorating medical conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 53 polynucleotides, based on which tissues they are most highly expressed in (see AAX79011 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; secreted protein; fusion protein; gene therapy; protein therapy; diagnosis; tissue; cancer; tumour; neurodegenerative disorder; leukaemia; developmental abnormality; foetal deficiency; blood; allergy; renal; immune system; asthma; lymphocytic disease; brain; hepatic; lymphoma; inflammation; ischaemic shock; Alzheimer's disease; restenosis; AlDS; cognitive disorder; schiothenia; prostate; obesity; osteoclast; thymus; osteoporosis; arthritis; testis; lung; thyroiditis; thyroid; digestion; endocrine; metabolism; regulation; malabsorption; gastritis; neoplasm.
                          This is the uridine-binding motif of the dCTP deaminase of Eschericha coil. Sequences are provided (see AAW72849-57) of the uridine-binding motifs of dUTPases and dCTP deaminases of Pyrococcus furiosus (see AAW72847), Methanococcus jannaschii, Pyrococcus furiosus (see AAW72847), Methanococcus jannaschii, Bosulfurolobus ambivalens, Escherichia coil, yeast, human and herpesvirus; a consensus (see AAW72848) is also provided. A claimed method of enhancing a nucleic acid polymerase reaction comprises performing the reaction in the presence of one or more of the following: a polymerase enhancing factor (PEF), a dTPPase, a cfollowing: a polymerase enhancing factor (PEF), a dTPPase, a ctivity comprises one or more of sequences provided in AAW72848-57. A claimed protein having PEF activity comprises one or more of sequences given in AAW72848-57.

Kits are provided for replicating nucleic acids, for site-directed mutagenesis, for nucleic acid sequencing or for amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.
            mutant of coryneform bactérium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.
useful for identifying the mutation point of a gene derived from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in certain diseases
                                                                                                                                                                                                                                                            Gaps

number of apoptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apoptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the S. cerevisiae

proteins of the invention.

733 AA;

Sequence

The present invention provides the protein and coding sequences of a

```
Auto13501-AAU03557 represent novel human protein kinases #1-57. The novel protein kinases have been identified as members of the tyrosine or serine/threonine kinase (PTK and STK) families. The polynucleotides cor serine/threonine kinases and the polymeptides may be used in the provention, diagnosis and treatment of diseases associated with cancers (especially cancers of hematopoletic origin), cardiovascular cancers (especially cancers of hematopoletic origin), cardiovascular disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), inflammatory disorders (e.g. asthma), infectious parkinson's disease), inflammatory disorders (e.g. asthma), infectious disease (e.g. HIV) and reproductive disorders (e.g. inflammatory disorders (e.g. infertility).

Additionally, polynucleotides encoding protein kinases may be used as for gene therapy and as DNA probes in diagnostic assays.

The protein kinase epolypeptides may be used as antigens in the production of antibodies against the protein kinases and in assays to identify modulators of protein kinase expression and activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present sequence represents a Pasteurella multocida strain R1913 ManH neutraminidase immunogenic peptide. The present invention also describes: an immunogenic composition comprising a recombinant neuraminidase from P. multocida (shown in AAW48668) or the immunogenic peptides shown in AAW48869 to AAW48869. Or the immunogenic assay kit for the diagnosis and/or detection of P. multocida, comprising an antibody specific to P. multocida neuraminidase and antibody. The neuraminidase protein and immunogenic peptides can be used to immunise and protect animals, e.g. sheep, cattle, rabbits, dogs, cats, chickens, turkeys and humans against P. multocida diseases such as fowl cholera, shipping fever in cattle, respiratory tract infections, abscesses and systemic oligonucleotides derived from it, or the antibody can be used to diagnose P. multocida infections.
                                                                                                                                                                                                                                                                                                                  Pasteurella multocida neuraminidase - useful for protecting animals and humans from P. multocida infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cellulose; CBD; hemicellulosic substrate;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a set of complementary peptide ligands generated from the human genome. The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                              Human; complementary peptide; ligand; drug discovery; drug design.

                                                                                                                                                                                                                                                                      ó
                                                                                                  This CBD is homologous to a terminal A region of Trichoderma reesei cellulases and effects binding of a protein to an insoluble cellulosic or hemicellulosic substrate. It is one of ten specific CBD's (see AAR15244-R15253) which correspond to the generic CBD formulae in AAR15242 and AAR15243. The CBD is incorporated into a fusion protein comprising a catalytic domain from a cellulase, e.g. a Bacillus endoglucanase, and optionally comprising a linking B domain from e.g. a fungal endoglucanase.

The present invention relates to a nucleotide construct with optimised codons for use as a human immunodeficiency virus (HIV) DNA vaccine. The construct uses codons from highly expressed mammalian proteins to code for each derivative of an early, primary HIV envelope gene. The first stage in the production of the construct was the cloning of an HIV

They are also useful to identify those DNA sequences and enzymes in other species which are useful to modify the biosynthesis of starch, cell wall polysaccharides and sugars. The nucleic acid molecules may be utilised in the genetic engineering of Corynebacterium glutamicum and the
envelope gene. A nucleotide sequence encoding this gene was then created using codous from highly expressed mammalian genes. The present sequence is the peptide encoded by one of the snuts (AAA49006-A49079) that were created by redesigning the nucleotide construct so that restriction enzyme sites surrounded functional regions of the sequence. The snuts were then assembled into pieces (AAA49080-A49092). Each derivative of the envelope gene (AAA49097-A49097) was then built using the pieces. The HV DNA vaccine may be used as a prophylactic vaccine and as a therapeutic vaccine in HIV infected patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel moss nucleic acid molecules encoding a carbohydrate metabolism related protein useful for modulating production of fine chemicals such as carbohydrates, cofactors and enzymes from microorganisms and plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to nucleic acid molecules AAH88708 - AAH88796 isolated from Physcomitrella patens (a moss), which encode carbohydrate metabolism related proteins (CMRP) represented in AAM00022 - AAM00110. Included in the invention is a vector containing the CMRP CDNA, and a host cell transformed with the vector. The host cell (a microorganism,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Corynebacterium or Brevibacterium, moss or algae or a plant cell) is useful for producing a fine chemical such as carbohydrates, cofactors and/or enzymes. The nucleic acid molecules are suitable for modifying a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents a Taxus cuspidata oxygenase, encoded by a DNA of replantion. The sequences isolated from the Taxus genus, and the respective oxygenases are useful for the synthetic production of Taxol and related taxolds, as well as intermediates within the Taxol biosynthetic pathway, and other taxold derivatives. The sequences also can be used to make transgenic organisms that either produce the oxygenases for subsequent in vitro use, or produce the oxygenases in vivo so as to alter the level of Taxol and taxoid production within the transgenic organism. The oxygenase nucleic acids and amino acids are corresponding to full-length oxygenases.
related Brevibacteium species and Acetobacter xylinum and Chlorella to make it a better or more efficient producer of one or more file chemicals. Mutagenesis of one or more CMRPs may also result in CMRPs having altered activities which indirectly impact the production of one or more desired fine chemicals indirectly impact shalls705 - AAH80707 are used in the sequencing of the CMRP cDNA sequences of the invention.

AAD05389-AAD05473 represent cDNAs corresponding to 29 human secreted protein genes, and AAE01546-AAE01630 represent the proteins they encode. AAE01631-AAE01660 represent human secreted protein fragments or variants. The secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene amount of the new protein in a sample or by determining the mount of the new genes. Specific uses are described for each of the
                                                                                                                                                                                                                                                                               Human; secreted protein; proliferative disorder; cancer; tumour; foetal abnormality; heamatopoletic disorder; immune system disorder; AIDS; autoimmune disease; rheumatoid arthritis; inflammation; allergy: neurological disorder; Alzheimer's disease; parkinson's disease; cognitive disorder; Alzheimer's disease; cognitive disorder; schizophrenia; asthma; skin disorder; psorfasis; sepsis; diabetes; atherosclerosis; cardiovascular disorder; majogenic disorder; kidney disorder; gastrointestinal disorder; pregnancy-related disorder; endocrine disorder; pregnancy-related disorder; endocrine disorder; infection; wound healing; vulnerary; cell culture; chemotaxis; food additive; gene therapy; binding partner identification; chromosome 16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding 29 human secreted polypeptides, useful for preventing, diagnosing and/or treating e.g. cancers, Parkinson's disease and diabetic retinopathy -
                                                                                                                                                                                                                                                   Human gene 22 encoded secreted protein HT4ES80, SEQ ID NO:167.

and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foctal and developmental abnormalities, haematopoletic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, alsergies, neurological disorders (e.g., Alzheimer's disease, canforders) alsergies, neurological disorders, schizophrenia, asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin adjoin due to culture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunossasy service requence represents a human secreted protein of the invention.

Giordano J; Duclert A, Dumas Milne Edwards J,

WPI; 2000-500381/45 N-PSDB; AAC03266. New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

Claim 13; SEQ ID 7341; 71pp + CD-ROM; English.

The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs different total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' UTR is rarely included to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used to obtain full length cDNAs and genomic character an also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
               untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mappling procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               diagnostic, forensic, gene therapy and chromosome mapping procedures

```

```
The polynucleotide sequences given in AAG59738 to AAG59787 encode the human secreted proteins given in AAB4577 to AAB34686. AAB34627 to AAB34686 represent human secreted proteins plant polynucleotide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and calls the genes are expressed in Example of activities include: antiatriviti. Immunosuppressive; antirhenment.; antiproliferative; cardiant; vasotropic; cerebroprotective; noctropic; ophthalmological. The polynucleotides and proteins can be are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep: They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include cancers of the breast or liver, cardiovascular disorders.

Cerebrovascular disorders, andiogenesis, nervous system disorders.

Cerebrovascular disorders, andiogenesis, nervous system disorders.

The proteins can also be used to aid wound healing and epithelial cell
                                                                                           ó

CC proliferation, to prevent skin aging due to sunburn, to maintain organs are before transplantetion, for supporting cell culture of primary tissues. CC to regenerate tissues and in chemotaxis. The proteins can also be used a food additive or preservative to increase or decrease storage or capabilities. AAC59729 to AAC59737 and AAB34576 represent sequences used cC in the exemplification of the present invention.

C; Superfamily: threonine dehydratase

C; Superfamily: producted prosphate (Lys) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 13
S59301
homothallic switching endonuclease - yeast (Saccharomyces cerevisiae)
NiAlternate names: HO endonuclease; homothallism protein; protein D0827; protein VDL227c
C;Species: Saccharomyces cerevisiae
C;Date: 08-Jul-1995 #sequence_revisiae
C;Date: 08-Jul-1995 #sequence_revision 01-Dec-1995 #text_change 29-Oct-1999
R;Raveh, D.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence 105, A sequence 105, Bequence 5, Ap Sequence 5, Ap Sequence 17, A sequence 17, A sequence 23, A sequence 23, A

Patent No. 5574144
GENERAL INFORMATION:
APPLICANT: KAMBOJ, Rajender
APPLICANT: ELLIOTT, Candace
APPLICANT: BLIOTT, Candace
TITLE OF INVENTION: THE EAA4 FAMILY
NUMBER OF SEQUENCES: 9
CORRESPONDENCE ADDRESS:
                        APPLICANT: Finkel, Terri H.

PAPLICANT: Rozdzial, Moshe M.

TITLE OF INVENTION: PRODUCT AND PROCESS TO REGULATE ACTIN
TITLE OF INVENTION: DOLYMERIZATION IN T LYMPHOCYTES
TOWNSHORDENCES: 31
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sheridan Ross & McIntosh
STREET: 1700 Lincoln St., Suite 3500
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 27;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention describes novel polypeptide fragment sequences (I) and their encoding nucleic acids (II) which are highly expressed in normal bladder tissue and have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are to directly agents suitable for the treatment of bladder tumours, to directly treat this form of cancer (including expression from gene therapy vectors), or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTs (expressed sequence tags) from a
                 This is the uridine-binding motif of the dUTPase of Escherichia coli. Sequences are provided (see AAM72849-57) of the uridine-binding motifs of dUTPases and dCTP deaminases of Pyrococcus furiosus (see AAM72847), Methanococcus jannaschii, Desulfurolobus ambivalens, AAM72847), Methanococcus jannaschii, Desulfurolobus ambivalens, AAM72848 is also provided. A claimed method of enhancing a nucleic acid polymerzae reaction comprises performing the reaction in the presence of one or more of the following: a polymerase enhancing factor (PEF), a dUTPase, a protein that turns-over dUTP and protein having one or more of the sequences provided in AAM72848-57. A claimed protein having PEF activity comprises one or more of sequences given in AAM72848-57. Kits are provided in AAM72848-57. A claimed protein acids, for site-directed mutagenesis, for nucleic acid sequencing or for amplification (preferably PCR or RT-PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ξ

The present sequence is a peptide encoded by one such probe. The SERPS are derived from human HeLa cells. The SENPS can be used to produce a single exon microarray, which can be used for epithelial upwan agene expression in a sample derived from human cervical epithelial cells. By measuring see expression, the probes are therefore cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of fallures because of ESTS from different libraries representing different parts of the same unknown gene distorting the estimated frequency of occurrence in a particular tissue. AAY6029-Y60591 represent protein fragments encoded by the human normal bladder tissue cDNA library derived EST fragments represented in AAZ42122-Z42248.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide #2525 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to novel single exon nucleic acid probes clear Asia (Month) and Asia (Month) and a periode concoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumnours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at tp.wipo.int/pub/published_pct_sequences.
                                                                                                                                    Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel single exon nucleic acid probe used to measuring gene expression in a human breast -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                         Peptide #2619 encoded by probe for measuring placental gene expression.

```
This sequence represents a Streptococcus pneumoniae protein that, based on homology with a Lactobacillus helveticus protein, is an ISLZ protein, and is encoded by a DNA sequence of the invention. The DNA sequences strain of the DNA sequences of the invention can be used to compendate proteins of the invention can be used to calcivity of the proteins of the invention can be used to calcivity of the proteins. Antagonists can be used to treat diseases caused by S. pneumoniae proteins, through genetic immunisation. They can look be used to induce an immunological response in a mammal by cancilation with the S. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein.

C. and be used to infedential initiated other than by the implantation of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                                                                                                Novel Streptococcus pneumoniae proteins and related DNA - useful for diagnosing anti-microbial agents for treatment of bacterial infections
                                                                                                                                                                                                                                                                                                                                                                    Claim 12; Pages 292-293; 483pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ò
            Staphylococcus aureus protein; ribozyme; antisense sequence; control; Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a Staphylococcus aureus protein of unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCCH 9 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regulatory elements for the control of bacterial gene expression. The present protein may be used to produce antibacterial action. These vaccines and antibodies with a host to produce specific antibodies with a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polypeptide(s) from Staphylococcus aureus strain WCUH29 - used to isolate antimicrobial compounds, and in vaccines against S. aureus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Streptococcus pneumoniae protein; genetic immunisation; antagonist; Immunological response; incculation; antibody production; inhibitor; T cell immune response; antimicrobial compound; bacterial adhesion; extracellular matrix protein; protein-mediated cell invasion; wound; pathogenesis.

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human single exon nucleic acid probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide #2268 encoded by probe for measuring cervical gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; microarray; gene expression; cervical epithelial cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human single exon nucleic acid probes (SENP: see AA11068-AA128459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical useful in grading and/or staging of diseases of the cervix, notably everycal cervical cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide #8891 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                        Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human cervical epithelial cells -

(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are defived from human HeLea cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                             cervical cancer.

Wote: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to single exon nucleic acid probes (SENP: see ANII)15-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Peptide #2381 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human placenta -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel single exon nucleic acid probes (see AAIOOOIO-AAIIO067). The present sequence is a peptide encoded by one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic capic expressed in the human breast. The probes are useful for predicting, disgnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actionary. The diseases include: breast cancer, disorders of development, inflammatory diseases include: breast cancer, disorders of development, breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                      Probe; human; breast disease; breast cancer; development disorder; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel single exon nucleic acid probe used to measuring gene expression in a human breast -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           4 - JUN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -JUN-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -NOC-8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           -NUC-8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides a number of nucleotide and protein are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotides derived from Coryneform bacteria, for identifying mutation point of a gene, measuring expression of a gene, analysing expression profile or pattern of a gene and identifying homologous gene

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
